#### ABSTRACT

This is the teacher's edition of the Record Book for the unit "Well-Being" of the Intermediate Science Curriculum Study (ISCS) for level III students (grade 9). The correct answers to the questions from the student text are recorded. An introductory note to the teacher explains how to use the book. Answers are included for the activities and excursions. A self evaluation section is followed by its answer key. (SA)

PUPILS to whom this textbook is issued must not write on any page or mark any part of it in any way, consumable textbooks excepted.

- 1. Teachers should see that the pupil's name is clearly written in ink in the spaces above is every book issued.
- 2. The following terms should be used in recording the condition of the book: New; Good; Fair; Peer; Red.

Charles M. Woolheater, F.S.U. Jay A. Young, King's College. Victor J. Young. Queensborough Community College.

The genesis of some of the ISCS material stems from a summer writing conference in 1964. The participants were:

Frances Abbott, Miami-Dade Junior Callege. Ronald Atwood, University of Regiucky. George Assouss, Carnegle Institute. Colin H. Barrow. University of West Indies. Peggy Bazzel, F.S.U. Robert Binger (deceased). Donald Bucklin, University of Wisconsin. Martha Duncan Camp, F.S.U. Roy Campbell, Broward Caunty Board of Public Instruction. Fla. Bruce E. Cleare. Tallahassee Junior College. Anna-cile Hall, Pensacola, Florida. Charles Holoolmb, Mississippi State College. Robert Kemman, Mt. Prospect, Ill. Gregory O'Berry, Coral Gables, Florida. Elra Palmer, Baltimore. James Van Pierce, Indiana University Southeast. Guenter Schwarz, F.S.U. James E. Smeland, F.S.U. C. Richard Tillis, Pine Jog Nature Center, Florida. Peggy Wiegand, Embry University. Elizabeth Woodward, Augusta College. John Woolever, Sarasota, Florida.

## **Foreword**

A pupil's experiences between the ages of 11 and 16 probably shape his ultimate view of science and of the natural world. During these years most youngsters become more adept at thinking conceptually. Since concepts are at the heart of science, this is the age at which most students first gain the ability to study science in a really organized way. Here, too, the commitment for or against science as an interest or a

vocation is often made.

Paradoxically, the students at this critical age have been the ones least affected by the recent effort to produce new science instructional materials. Despite a number of commendable efforts to improve the situation, the middle years stand today as a comparatively weak link in science education between the rapidly changing elementary curriculum and the recently revitalized high school science courses. This volume and its accompanying materials represent one attempt to provide a sound approach to instruction for this relatively uncharted level.

At the outset the organizers of the ISCS Project decided that it would be shortsighted and unwise to try to fill the gap in middle 'school science education by simply writing another textbook. We chose instead to challenge some of the most firmly established concepts about how to teach and just what science material can and should be taught to adolescents. The ISCS staff have tended to mistrust what authorities believe about schools, teachers, children, and teaching until we have had the chance to test these assumptions in actual classrooms with real children. As conflicts have arisen, our policy has been to rely more upon what we saw happening in the schools than upon what authorities said could or would happen. It is largely because of this policy that the ISCS materials represent a substantial departure from the norm.

The primary difference between the ISCS program and more conventional approaches is the fact that it allows each student to travel at his own pace, and it permits the scope and sequence of instruction to vary with his interests, abilities, and background. The ISCS writers have systematically tried to give the student more of a role in deciding what he should study next and how soon he should study it. When the materials are used as intended, the ISCS teacher serves more as a "task easer" than a "task master." It is his job to help the student answer the questions that arise from his own study rather than to try to anticipate and package what the student needs to know.

There is nothing radically new in the ISCS approach to instruction. Outstanding teachers from Socrates to Mark Hopkins have stressed the need to personalize education. ISCS has tried to do something more than pay lip service to this goal. ISCS' major contribution has been to design a system whereby an average teacher, operating under normal constraints, in an ordinary classroom with ordinary children, can indeed give maximum attention to each student's progress.

The development of the ISCS material has been a group effort from the outset. It began in 1962, when outstanding educators met to decide what might be done to improve middle-grader science teaching. The recommendations of these conferences were converted into a tentative plan for a set of instructional materials by a small group of Florida State University faculty members. Small-scale writing sessions conducted on the Florida State campus during 1964 and 1965 resulted in pilot curriculum materials that were tested in selected filorida schools during the 1965-66 school year. All this preliminary work was supported by funds generously provided by The Florida State University.

In June of 1966, financial support was provided by the United States Office of Education, and the preliminary effort was formalized into the ISCS Project. Later, the National Science Foundation made several additional grants in support of the ISCS effort.

The first draft of these materials was produced in 1968, during, a summer writing conference. The conferees were scientists, science educators, and junior high school teachers drawn from all over the United States. The original materials have been revised three times prior to their publication in this volume. More than 150 writers have contributed to the materials, and more than 180,000 children, in 46 states, have been involved in their field testing.

We sincerely hope that the teachers and students who will use this material will find that the great amount of time, money, and effort that has gone into its development has been worthwhile.

# Notes to the Student

This Record Book is where you should write your answers. Try to fill in the answer to each question as you come to it. If the lines are not long enough for your answers, use the margin, too.

Fill in the blank tables with the data from your experiments. And use the grids to plot your graphs. Naturally, the answers depend on what has come before in the particular chapter or excursion. Do your reading in the textbook and use this book only for writing down your answers.

## **Notes to the Teacher**

In almost every instance, variable answers are of a quantitative nature and are based on measurements the students themselves make. In these cases, other answers may also be accepted.

Conclusions:
•
1
lt controls the production of mucus and the movement of cilia
It helps to control the buildup of dust and particles in the lungs
There is an increase in goblet cells and basal cells, with
corresponding decrease in ciliated cells, in Figure 2-3.
The cell production rate for basal cells must have increased
The cell production regulator sent a message to the cell produc-
tion controller to speed up production, which it did.
More mucus would be produced. Also, they would crowd out
the ciliated cells.
The mucus and foreign matter would not be pushed into the
nose and mouth for removal.
There is a direct relationship between coughs and other respira-
tory ailments and smoking.
The air sacs have broken down and enlarged.
It would be likely to make breathing more difficult.
There is a direct relationship between amount of smoking
and thickening of epithelium.
b. There is a direct relationship between amount of smoking
and the presence of abnormal cells.

Up

<b>□4-3</b> .	(Discussions will vary. Some students may feel that 0.10% is too
high b	necause there is 8 times as much chance of an accident at that
point.	Some may feel that it is too low because Table 4-2 seems to
	te that physical impairment begins at 0.12%.)
<del></del>	AL SECTION AND ADDRESS OF THE PROPERTY OF THE
	4 times; 8 times; 25 times
	45 minutes (3 hour)
	The effect began immediately and lasted for 2½ hours.
	(List should include some of the following: age, weight, size, cal condition, how much it was diluted, what it was mixed with,
kind a	and amount of food in stomach, speed of elimination from body,
body	tolerance, effects of other drugs.)
	Heavy people have more blood vessels (and blood) and therefore
the b	lood-alcohol level is lower for a particular amount of alcohol
consu	med.
[ ]4-0	A depressant is a substance that slows down body activity a
meas	urable amount.

on is

Useful: relieve pain, lessen nervousness, induce sleep, control
undesirable behavior, control high blood pressure, treat epilepsy, stop
coughing.
Dangerous: lower blood pressure too far, decrease body resist-
ance to disease, cause unclear speech and loss of coordination, slow
reactions, harm ability to think clearly, destroy concentration, cause loss
of control of emotions, cause physical and psychological dependence,
cause stupor or death when two are used together.
•
5-1. Predictions should include some of following: increase pulse,
increase breathing rate, increase blood pressure, pep you up, wake you
up, make you less tired, make you eat less, slow reflexes.
•
5-2. Predictions may include some of following: make you nervous,
excitable, uptight; affect your judgment; make you behave erratically;
make you violent.
•

of violence.	
11. (Student conclusions will vary, but they should sum up the data	•
on DSST, time estimation, heartbeats, and effects.)	

# How Well Am I Doing?

You probably wonder what you are expected to learn in this science course. You would like to know how well you are doing. This section of the book will help you find out. It contains a Self-Evaluation for each chapter. If you can answer all the questions, you're doing very well.

The Self-Evaluations are for your benefit. Your teacher will not use the results to give you a grade. Instead, you will grade yourself, since you are able to check your own answers as you go along.

Here's how to use the Self-Evaluations. When you finish a chapter, take the Self-Evaluation for that chapter. After answering the questions, turn to the Answer Key that is at the end of this section. The Answer Key will tell you whether your answers were right or wrong.

Some questions can be answered in more than one way. Your answers to these questions may not quite agree with those in the Answer Key. If you miss a question, review the material upon which it was based before going on to the next chapter. Page references are frequently included in the Answer Key to help you review.

On the next to last page of this booklet, there is a grid, which you can use to keep a record of your own progress.

### Notes for the Teacher

The following sets of questions have been designed for self-evaluation by your students. The intent of the self-evaluation questions is to inform the student of his progress. The answers are provided for the students to give them positive reinforcement. For this reason it is important that each student be allowed to answer these questions without feeling the pressures normally associated with testing. We ask that you do not grade the student on any of the chapter self-evaluation questions or in any way make him feel that this is a comparative device.

The student should answer the questions for each chapter as soon as he finishes the chapter. After answering the questions, he should check his answers immediately by referring to the appropriate set of answers in the back of his Student Record Book.

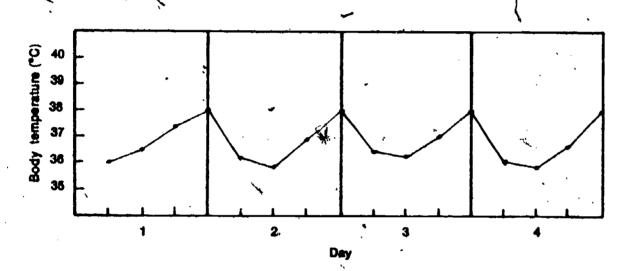

There are some questions that require planning or assistance from the classroom teacher or aide. Instructions for these are listed in color on the pages that follow. You should check this list carefully, noting any item that may require your presence or preparation. Only items which require some planning or assistance are listed.

You should check occasionally to see if your students are completing the progress chart on page 53.

Circle any of the excursions for this chapter that you completed. 1-1; 1-2; 1-3; 1-4

**SELF-EVALUATION 1** 

1-1. Use the graph below to answer the questions that follow/

- a. Based on the above graph, what is the set point for the person's body temperature?
- b. At about what temperature does this person's "body thermostat" turn on the body's heat supplier?
- c. Which of the following is not a "normal" temperature for this person: 37°C; 39°C; 38°C; 36°C?

1-2. State an operational definition for the term calorie.

1-3. What is the relationship between	een a calorie and a Calorie?
1-4. How many calories of heat wo of water from 12°C to 19°C?	ould it take to warm up 40 grams
1-5. What two things will determine over a period of time?	
b	
1-6. In order to have a good diet, ye besides Calories. Name two of these	ou need other inputs to your body other inputs.

.44/45

# Self-Evaluation Answer Key

#### **SELF-EVALUATION 1**

- 1-1. a. About 37°C
  - b. About 36°C
  - c. 39°C

If you had trouble with this question, review pages 14 to 16 in Well-Being.

1-2. You should have included the following relationship in your answer: calories = mass (grams) X change in temperature (°C).

If you forgot the relationship, review Excursion 1-1.

**1-3.** 1,000 calories = 1 Calorie

See Excursion 1-1 if you had difficulties.

1-4. 280 calories

Review Excursion 1-1 if you missed this question. If you still cannot seem to understand how to get the answer, check with your teacher.

- 1-8. Your answer should have included these two ideas:
  - a. the number of Calories taken in
  - b. the number of Calories used

You should have mentioned that it is the number of Calories taken in and not just the amount of food you eat, because different foods contain different numbers of calories.

1-6. Visamins and minerals

Problems with this? Review page 22, right at the end of the first chapter.

1-7. The boy is overweight for his age and size by 15 lb.

If you had difficulty with this, you should review Excursion 1-

- 1-8. L. Your answer should have indicated that it is a system in which a change in the input produces an opposite change in the output. You might have said instead that it is a system in which the response is opposite to the stimulus. See pages 9 and 10 if you had difficulties.
- A. One of many examples possible is the heating or cooling system in your house. Another would be a driver in a car. In both cases a change in some variable (temperature or direction of motion) is detected by a detector (thermostat, driver) that causes a change in the system to compensate for the change detected (furnace goes on, driver turns steering wheel). Your example should be a system that contains those same parts.

46/47

- 1-9. Your design should include plans to do the following things
  - I. Keep an accurate record of the rabbit's weight
- 2 Keep track of all the food he consumes every day and find out how many Calories are in this food.
  - 3. Keep the rabbit healthy by seeing that he gets the necessary vitamins and minerals
- 4. Vary the Calorie intake of the rabbii each week until at a certain input level its body weight is maintained practically unchanged for an entire week.

If you had planned to use this procedure with several rabbits instead of with just one, you could have more confidence in your findings.

#### SELF-EVALUATION 2

.2-1. a. Jar A was used as a control. In many experiments, what you are interested in is the difference between a control and an experimental group.

b. There is some evidence that points to the possibility that the solution of cigarette chemicals prevented the corn seeds from germinating. However, you can't be sure. There is the possibility that the seeds that were put in jar B would not have germinated even if they had been put in tap water. You would have to repeat this experiment several times beforegou could be certain that it is the cigarette chemicals in the solution that is preventing the seeds from germinating.

- 2-2. a. Goblet cells tend to enlarge and produce more mucus.
  - b. Ciliated cells become fewer and beat more slowly.
  - c. Air sacs are fewer and have thicker walls

If you had difficulty answering these, review pages 31, 32 and 34.

- 2-3. This question probably made you think a bit. I ung cancer death rates and the number of eigarettes smoked have increased together. Even though there is strong evidence that there is an association between the increase in deaths from lung cancer and the number of eigarettes smoked, there is no evidence that one causes the other. If smoking causes cancer, then all smokers should get lung cancer unless they die accidentally while they are still young. There is, however, a great deal of evidence that the two things are related. But there is no evidence for a cause-and-effect relationship at the present time. You might want to look at the bar graph on page 40 again.
- 2-4. 1. Cigarettes
  - 2. Cigars
  - 3. Pipes

See page 44 if you had difficulties with this question.

- 2-5. a. Increased heartbeat rate for smokers.
  - b. Increased breathing rate while resting for smokers
  - c. Increase in amount of CO in the exhaled air for smokers

See pages 35 and 45 if you found these questions difficult.

- 2-6. This was not an easy question to answer. You know that the fairly minor changes that are associated with smoking disappear when people stop smoking. Extra mucus stops being produced, the ciha beat faster, and the epithelium of the lungs gradually becomes thinner. Also, excess coughing seems to disappear. The data in Figure 2-16 indicates that stopping smoking even reduces the rate of death from lung cancer. You might also reread pages 46 and 47.
- 2-7. You probably thought about this question for a while. There are several possible answers. One main reason is that so far the evidence does not establish a cause-and-effect relation between smoking and cancer or other diseases. Another reason is that perhaps the law could not be enforced even if Congress did pass it. You will get a chance to examine this question in greater detail a bit later in this unit.

2-0. Well, what did you check on this one? The evidence that cigarette smoking is harmful appears to be conclusive and thus should be considered. However, you may have a different opinion. You might want to discuss your answer to this question with some of your classmates or your teacher.

#### **8ELF-EVALUATION 3**

3-1. You should have indicated that a person is physically dependent on something if, when he suddenly stops using the substance, he gets a withdrawal illness

If you had problems writing an operational definition for physical dependence, you should review pages 49 and 50.

3-2. A person is psychologically dependent on a substance if he has a strong desire for the substance even though his body does not need the substance.

If you had difficulty with this question, read over page 51.

- 3-3. A "cold turkey cure" is when a person suddenly stops using a substance and gets a withdrawal illness. A gradual tapering off is not a "cold turkey cure."
- 3-4. You could have listed a variety of symptoms such as twitching, cramps, loss of appetite, and nausea. Check your list against those given in Table 3-1 on page 50.
- 3-5. A chemical that is introduced into the body may block the messages that are being sent from dectector to controller in your body's negative feedback systems. Suppose a bright light were placed in front of your eye. Normally this would cause your "light stat" to send a message to the pupil of your eye to close down. It is possible that a chemical introduced into your body might stop this message from going through. This could seriously injure your eye, which would be receiving too much light.

See pages 52 to 54 for a more detailed explanation.

3-6. One of the things a pregnant woman should consider before taking any drug is what effect it will have on her unborn child. In Chapter 2, you learned that tobacco shoke can affect the baby of a pregnant woman. It is also known that if a pregnant woman takes certain drugs regularly, her unborn child may become physically dependent on these drugs. The baby can be born an addict. You may have read or heard about other cases where chemicals taken by an expectant mother have affected her unborn baby.

See page 51 for more information about this.

#### **SELF-EVALUATION 4**

- 4-1. Depressants are chemicals that slow the body down.
- 4-2. Alcohol enters the bloodstream faster because it does not have to be digested. It goes unchanged from the digestive system into the bloodstream.

Review the section "How's Your A.Q.?" on page 60 if you had difficulty with this question.

4-3. You may have mentioned several factors but the two main ones are the person's weight and whether the person is a new drinker or not. Other important factors include whether the person is drinking on an empty stomach or has just eaten and whether the person uses other drugs at the same time he is drinking.

If you had difficulty with this question, you should go over the sections "Variation of Effect," on page 64, and "It's Not So Simple," on page 65.

- 4-4. There are several medical uses of depressants. Your answer should have included two of these to relax patients, to treat high blood pressure, to prevent epileptic seizures, to help people sleep, to telieve pain, and to reduce coughing. See Table 4-1 if you need help
- 4-5. You may have had to think about this question for a minute. The reason is that dirty needles would tend to spread diseases from one person to another. The use of dirty needles is what causes people who inject chemicals into their body to get diseases such as hepatius as well as infections that cause boils. Page 59 discusses this problem
- **4-6**. The data presented in Figure 4-2 on page 63 shows the telationship between the chance of having an accident and the blood-alcohol level. It indicates that the chance of having an accident increases very rapidly as the blood-alcohol level tises.
- 4-7. You should have indicated in your answer that one drug or chemical can cause your body to react differently to another drug. An example of this is the relationship between alcohol and carbon tetrachloride. Carbon tetrachloride has been used for years as a cleaning agent and was thought to be fairly harmless. However, if you have been drinking and then breathe in the fumes of carbon tetrachloride, you are very likely to have a severe case of kidney poisoning that may result in death. It is wise not to mix drugs even if it is "common knowledge" that they can't hurt you. Page 65 can help here.
- 4-8. This was a personal opinion question. In your answer you should have considered the possible harmful effects of depressants and what could possibly happen if they are readily available to all people. It is interesting that regulations as to the sale of these cough medicines vary from country to country. In the United States a prescription is required, while in Canada they are sold without a prescription although there is a legal limit on the codeine content.
- 4-9. a. Donald is probably kidding himself
- b. He is more than likely well on the way to becoming a drug addict. Even though he may want to quit, he may not be able to because the withdrawal illness would be too much for him to deal with
- c. The other dangers he faces include the possibility of hepatitis from dirty needles, infection, the danger of an overdose, etc.

#### **SELF-EVALUATION 5**

- 5-1. Stimulants are chemicals that speed up the body's activities.
- 5-2. There are several psychological effects of stimulants. Your answer should include two of these nervousness, irritability, uninhibited behavior, confusion.

If you named other effects or you weren't able to think of any, check over the section on page 69.

- 5-3. A regular user of a drug may develop a tolerance for the drug. His body gets used to the chemical and no longer reacts in the same way. As this tolerance increases, the person requires larger and larger doses to get the same effect.
- 5-4. A hallucinogenic drug is one that affects the mind so that the world, as detected by the senses, is distorted. If you would like to find out more about hallucinogens, see Excursion 5-1.
- 5-5. We hope that you said No to this question. Stimulants do not get rid of tiredness. They just help the body use up its stored energy. However, this energy is limited and as a result a person may suddenly run out of energy without warning. This may occur just before or during the test, and as a result the student may find that he falls asleep during the test itself. The best idea seems to be to study well ahead of time so that you can get a good night's sleep on the night before the test. Try it—it really works!

- 5-6. Not very much is known about the physical changes that occur when one uses halfucinogenic drugs. In fact, the effects found so fai do not always seem to be too serious. In some cases, such as with LSD, there is some evidence to indicate that there may be some chromosome damage. One thing that may point to a physical change occurring as the flashbacks that can occur after taking hallucinogens such as LSD. You must keep in mind that the lab tests of the drugs make use of very pure drugs. The drugs that are sold "on the street" may well not be pure. As a result, the other chemicals they contain may produce severe illness, such as that caused by taking LSD that has been mixed with strychnine, a deadly poison.
- 5-7. It is quite possible that the person has taken a depressant, for he is exhibiting many of the characteristics of an individual under the influence of a depressant. Refer back to Chapter 4 if you are not sure.
- 5-8. This is a question for which there is no right or wrong answer. You are asked to make a decision about how you would vote on the question of the legalization of marijuana and why. The most important thing to do in making your decision is to try to consider all the evidence and all the points of view before making up your mind. Voting for or against the use of marijuana should not be based on pure emotions. It should be based on evidence about the effects marijuana may have on people. Remember that a deciston based on present evidence may not be valid in five years. Researchers may find more evidence one way or the other. You may want to talk this over with your classmates or even with your parents, asking them how they would vote and why.

#### **SELF-EVALUATION 6**

- 6-1. a. A double-blind experiment is one in which neither the doctor nor the patient knows whether the patient is receiving the treatment or placebo.
- b. This method is necessary to counteract a human effect on both doctor and patient. If a person thinks something will have an effect on him, his belief may cause the effect to occur. And patients can sense whether or not the doctor expects an effect to occur. Experimenters have to be able to tell the difference between the change due to the treatment and the change due to the person's belief that there will be a change. (See page 86 for more information.)
- 6-2. Your answer should have included the two main reasons why laws are made:
  - a. To protect people from other people
  - b. To enforce some people's idea of what is morally correct
  - If you had difficulties with this question, read over the sections on pages 86 through 88.
- 6-3. Some laws are more difficult to enforce than others simply because people are not willing to abide by them. The reasons for not abiding by the law may be economic reasons, selfish reasons, and sometimes unknown reasons. If enough people do not obey a law, it becomes impossible to enforce. Under these conditions the law is often ineffective and must be repealed.
- 6-4. There were many people who continued to drink alcohol in spite of the laws against its consumption. These people were willing to accept the risks in drinking, and they felt that they had the right to make their own choice. Most people felt that it was unfair to impose the prohibition laws on everyone. If someone chose not to drink, that was fine, but why impose the moral judgments of these people on everyone. As more and more people refused to obey the laws, law officers found that the laws had become completely unenforceable.
- 6-5. There are many possible reasons you could have given. Some of the reasons are given below.
- a. Many jobs depend on the alcohol industry, but very few depend on the sale or manufacture of illegal drugs.
- b. The sale of alcohol provides the government with a great deal of tax revenue, but the sale of illegal drugs does not.

- c. The use of alcohol is widespread, while the use of drugs is not nearly so widespread
- d. People are familiar with the use of alcohol and its resulting problems, but most people are hesitant about allowing the use of new and unfamiliar drugs
  - . Many people in important and powerful jobs use alcohol, but few are drug users.
- 6-6. Well, you may have listed many arguments for and against a law to outlaw the manufacture and sale of cigarettes. Compare your list with the lists of some of your classmates. You might want to discuss this with your classmates, your teacher, or your parents.

## My Progress

Keep track of your progress in the course by plotting the percent correct for each Self-Evaluation as you complete it.

Percent correct = 
$$\frac{\text{Number correct}}{\text{Number of questions}} \times 100^{\circ}$$

To find how you are doing, draw lines connecting these points. After you've tested yourself on all chapters, you may want to draw a best-fit line. But in the meantime, unless you always get the same percent correct, your graph may go up and down like a series of mountain peaks.

**RECORD OF MY PROGRESS**
